Crystalline Solar Cells

Efficient Recipe Management: Central Recipe Tool

The Key for Higher Productivity and Consistent Quality Standards with Minimum Effort

Requirements & Targets

Same quality standards - everywhere, every time

- Multiple inspection systems perform identical inspection tasks on different production lines simultaneously
- All systems use the same recipe for detection and classification, changes to the central recipe are applied to all systems

System Application

Efficient management of systems in multiline production environments

- Enforce the use identical inspection recipes in all systems
- Fast roll-out of recipe changes
- Recipe Version Control for ISO 9001 quality management

Inspection Solution

Central Recipe Tool (CRT) for central recipe management

- Server-based software for management of recipes: create or import, edit, and release
- Version management compare recipe versions and keep track of recipe changes
- Automatic roll-out of recipes to defined system groups, or simply by system type

Benefits for Production

Higher productivity and consistent data for production analysis

- Reduced engineering time for recipe adjustments per line, avoid redundant work
- Using identical recipes in all lines ensures that all systems use the same quality criteria – for cross-line yield loss analysis

Software Features	
CRT Server Application	System Requirements: Docker Engine (available for all operation systems), 75 GB Hard drive, min. 4 GB RAM for Docker Container
CRT Client	Import, create, checkout/ check-in, compare, export, (de)activate and release recipes for use in production
	System Requirements: Windows 7 or higher, optional installed GP Suite or Offline Recipe Manager

Application Examples

Central Recipe Tool with change log, version control, recipe comparison, and automatic recipe roll-out after release allows centralized management and tracking of all inspection systems.
